ENGL 314 - Group Evaluation for Technical Description
8/4/19

      Overall, I believe that our group did a very good job on our technical description of a process. Due to our topic selection, we were able to split up the work in a way that allowed for the best productivity. Our topic involved knowledge in Software Engineering. Two of our members were familiar with this discipline, while the other was not. We were able to use this to our advantage by having our non-expert team member dictate whether or not the information we were providing made sense, so that we could make the necessary adjustments. Since our team was marketing to a non-expert audience, I feel that we did an exceptional job in providing readable and understandable information to our readers. An area that our group struggled with is team communication. We did not do the greatest job of selecting a time in which we were all available to collaborate, which resulted in some of the members doing work at times when not everyone was available. This caused some confusion in our group, but we were able to work through this. I will extend this to say that since we did not establish a member as the team leader, we struggled to promptly select a topic for this description so that we could start working as soon as possible. Although there were things that could have been done better, I am confident that our group produced a very respectable piece of work.
